

Matrix42 Endpoint Security with cynapspro

Did you already know?

Data theft - an increasing problem in today's economy. That's why companies invest in firewalls and virus-scanners and therefore feel protected from external attacks. But do these investments also protect from internal attacks? In these days, it is very easy to steal internal data past firewalls without anybody recognizing. Either data is burned on CD/DVD or copied on an USB-stick. In general, data misuse will be detected when it is too late and your competitor or the whole world gets access to your data via the internet.

CryptionPro

- ▶ Efficient file encryption of mobile storage devices.

USB mass storage devices, memory cards and other external devices can easily store a data volume of several gigabytes, that will leave the office in someone's pocket. These small, mobile storage devices are easy to forget or lose, which can cause immense economic damage if they fall into the wrong hands. Still, these small, mobile storage devices provide a valuable service and preventing all employees from using them would be unnecessarily restrictive. CryptionPro automatically and reliably encrypts the data on mobile storage media without disrupting the user and keeps your data safe. Users won't even notice! CryptionPro provides the protection needed without depriving employees of the use of mobile storage media.

CryptionPro 2009 will guarantee, that

- ▶ no unauthorized people can read your data.
- ▶ even the entire hard disk can be encoded.
- ▶ the loss of an external mass storage device or the computer is not a security risk.
- ▶ data on external devices is automatically encrypted through background processes.
- ▶ wherever you may be, you can always access your encrypted data.

DevicePro

- ▶ Prevent data leakage by controlling access to external storage media.

The loss of data caused by the use of mobile storage media has been increasing strongly and steadily. Unmanaged mobile storage media, in particular memory sticks and external hard drives that are connected through the USB port, are a threat to any company or institution. DevicePro reliably prevents data loss or the import of malign or unauthorized software by controlling access to all external devices. Draw a line and improve data security now with DevicePro. Do not wait to react until it is too late. Protect your network today and manage your equipment efficiently and intuitively with DevicePro.

DevicePro will guarantee, that

- ▶ no one can carry out in-house data by simply using a USB-thumb drives or an external hard disc.
- ▶ no one will bring in viruses, trojans or other infections via USB-thumb drives or other external devices.
- ▶ only USB-drives, digital cameras and storage media corresponding with company policies will be allowed.
- ▶ only those employees with proper authorization will be permitted to use external devices.

Controlled Data Transfer, Secure Data Transportation

▶ **Sophisticated Rights Assignment based on Users or Computers**

Control individual access rights directly for groups, users and computers. This reduces the administrative burden and ensures transparency.

▶ **Synchronization of User Directories**

Already existing users and user group definitions in Microsoft Active Directory or Novell eDirectory are synchronized with the cynapspro management console. No double efforts with regard to the definition of users and usergroups for access control lists.

▶ **Complete Offline Support**

Using secure remote authorization codes, access rights for computers that are not connected to the network can be changed at any time. MobileCrypton allows users to access encrypted data anywhere and at any time.

▶ **Flexible Device Management**

Device permissions may be set for device types, device models or individual devices defined by serial numbers. You can therefore benefit from the use of corporate devices without compromising security.

▶ **Secure File Management**

You can permit or stop the data transfer to and from devices depending on the file type. You can thus prevent the copying of in-house data to external memory stores and therefore its possible misuse or loss.

▶ **Intuitive Management Console**

The central, user-friendly management interface makes it possible to assign complex settings with a few mouse clicks. The console and the locally installed agent are available in various languages.

▶ **Comprehensive Analysis, Protocols and Reports**

Information about access rights, access control, blocked requests, etc. can be evaluated, analyzed and exported.

▶ **Shadow Copy feature allows complete recording**

Password protected, detailed access protocols including filtering and sorting options. You can tell who accessed which files and are able to view the data. Even print jobs can be recorded. All changes in access rights or in the system settings are recorded in an audit-proof manner.

▶ **Distributed Environments**

Several servers replicating each other can be used at the same time.

▶ **Inventory of devices**

All external storage devices (USB etc.) used in the company are stored in the central database – giving you a complete overview at all times. The data can be used for capacity planning, for risk analyses or for asset management. The inventory can be carried out agentless which means you are able to analyze your device stock before introducing the endpoint protection solution.

Software solutions by cynapspro

- ▶ With the products from cynapspro, Matrix42 offers leading solutions for Data Loss Prevention (DLP) for data protection at the endpoints of corporate networks. cynapspro solutions shield your company from vulnerabilities arising from the use of new storage media such as the loss of theft of a USB device or notebook to the unauthorized use of specific applications. cynapspro solutions include device management and data encryption on external storage devices and the hard disk.
