

# Matrix42 Package Robot

Packaging with a single mouse-click and no college degree in packaging. Matrix42 Package Robot goes far beyond standard packaging methods.

With Matrix42 Package Robot, new software needs only be installed once. The installation recorder records the details of the entire process, including mouse and keyboard entries and browser authentication. The recorded process is packed as an exe file automatically with the option to modify it manually. Simply launch this exe to perform the complete installation process without errors or unnecessary steps.

Just record an install once and repeat it any number of times!

- ▶ **Simple packaging**  
Wizard-guided setup and recording
- ▶ **Reduced costs through fast repackaging**  
Automated administrative tasks and complex application and web application roll-out support
- ▶ **Reduced workload**  
Lines of business can package their applications themselves
- ▶ **Fast ROI**  
Faster return on investment in client management solutions

## Packaging Including Web Content

While other packaging solutions just execute a list of commands, Matrix42 Package Robot goes far beyond that: Even „newbies“ without any technical knowledge can use the solution to create packages. The installation recorder InstaRec records a sample installation and stores it as a ready-to-use package; this enables the lines of business to package their software themselves, which reduces the workload on IT.

The program detects typos and text similarities and matches entries or window text with default specifications. Matrix42 Package Robot features web content packaging: It also accounts for registry forms and browser windows commonly used for installations. The currency of the specified URL is also checked.

## Excellent Scripting

Matrix42 Package Robot features cryptographic encoding. This enables various subsidiaries to use the same script even with different data formats – a requirement that cannot be taken for lightly.

With the supplied editor, package scripting can be modified manually prior to distribution. Color marks provide a clear overview. You can use the drop-down menu to limit available instructions to specific issues such as mouse operations, registry and data transfer. It is possible to exclude file groups or address hidden windows separately.

- ▶ **Integrated installation recorder**  
InstaRec is the WYSIWYG recorder that captures the process in the background.
- ▶ **Automated entries**  
All keyboard and mouse entries are recorded and can be played for testing purposes. This also applies for changes to the registry, files or folders.
- ▶ **Online registration**  
Easily integrate web key access and other browser authentication methods into packages.
- ▶ **Easy-to-use controls**  
Programs can be easily modified in menus, buttons and lists.
- ▶ **Minimal training**  
Working with the Package Robot is very intuitive. Even lines of business can create their own packages without in-depth technical knowledge, reducing IT workload.
